

H-Sphere Plugins Screenshots

Last Updated Monday, 22 January 2007

This is how your end user will see our plugins. We choose the installation of Zen Cart as an example.

Every Application has a small Explanation and links to the Home as well as support pages. Clicking on Install will reveal the next page.

The Customer chooses where to install the Application and fills in the fields required.

After clicking submit the system creates the database, enables PHP (if not already enabled) ,installs and configures the application.

On successful install a new screen will confirm the installation and offer the customer with URL's to access the frontend and if available backend of the application.
